

# Recalculation Predicted Values

This application note describes how predicted values can be re-computed using a different predicted source than originally selected when tests were performed. This information applies to EasyOne Pro as well as Easy on-PC; i.e. to all products that use the software EasyWarePro.

The procedure described in the following influences the predicted values of all tests stored in the database. For safety reason we suggest to backup the database on an external device.

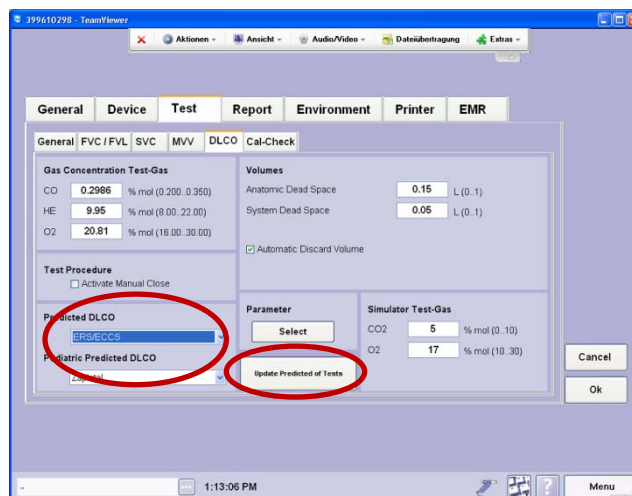

## 1 Backup database to an external device

Utilities → Advance → Enter Password: EOPTM → Export  
 Select: Patient Data  
 Browse: External device, e.g. USB memory stick

## 2 Perform recalculation of all tests in the database

Utilities → Configuration → Test → DLCO or FVC/FVL  
 Select the new predicted source. The button “Update Predicted of Tests” will now be active.  
 Press “Update Predicted of Tests”

Enter your ID, review the selected changes:

Finally confirm that all tests have to be updated using the new predicted source. It may take several minutes to update the database (depending on the number of tests stored).
